

NAME

ttys – terminal initialization data

DESCRIPTION

The *ttys* file is read by the *init* program and specifies which terminal special files are to have a process created for them which will allow people to log in. It consists of lines of 3 characters each.

The first character is either '0' or '1'; the former causes the line to be ignored, the latter causes it to be effective. The second character is the last character in the name of a terminal; e.g. *x* refers to the file */dev/ttyx*. The third character is used as an argument to the *getty* program, which performs such tasks as baud-rate recognition, reading the login name, and calling *login*. For normal lines, the character is '0'; other characters can be used, for example, with hard-wired terminals where speed recognition is unnecessary or which have special characteristics. (Getty will have to be fixed in such cases.)

FILES

/etc/ttys
