

NAME

ttyn – return name of current terminal

SYNOPSIS

jsr **pc,ttyn**

ttyn(file)

DESCRIPTION

Ttyn hunts up the last character of the name of the terminal which is the standard input (from *as*) or is specified by the argument *file* descriptor (from C). If *n* is returned, the terminal name is then “/dev/*ttyn*”.

x is returned if the indicated file does not correspond to a terminal.
