

NAME

setmnt – establish mnttab table

SYNOPSIS

/etc/setmnt

DESCRIPTION

Setmnt creates the **/etc/mnttab** table (see *mnttab*(V)), which is needed for both the *mount*(VIII) and *umount*(VIII) commands. *Setmnt* reads standard input, and creates a *mnttab* entry for each line. Input lines have the format:

filesystem node

where *filesystem* is the name of the file system's *special file* (e.g., "rp??"), and *node* is the root name of that file system. Thus *filesystem* and *node* become the first two strings in the *mnttab*(V) entry.

FILES

/etc/mnttab

SEE ALSO

mnttab(V)

BUGS

Evil things will happen if *filesystem* or *node* are longer than 10 characters.

Setmnt silently enforces an upper limit on the maximum number of *mnttab* entries.
