

NAME

`gmatch` – match a string with a pattern (like `glob(VIII)`)

SYNOPSIS

```
gmatch(string,pattern)  
char *string, *pattern;
```

DESCRIPTION

Gmatch acts just like (is copied from) the *glob* command. It returns zero on failure and one on success. The characters ‘?’, ‘[’ and ‘*’ have the usual meanings.

This function is kept in the **–IPW** library.

SEE ALSO

`sh(I)`, `glob(VIII)`
