

NAME

exit – terminate process

SYNOPSIS

(exit = 1.)

(status in r0)

sys exit

exit(status)

int status;

DESCRIPTION

Exit is the normal means of terminating a process. *Exit* closes all open files of the process, and notifies the parent process, if it is executing a *wait*. The low byte of r0 (resp. the argument to *exit*) is available as status to the parent process.

This call can never return.
