**NAME**

    umount – dismount file system

**SYNOPSIS**

    (umount = 22.)
    **sys  umount; special**

**DESCRIPTION**

    *Umount* announces to the system that special file *special* is no longer to contain a removable file system.  The
    file associated with the special file reverts to its ordinary interpretation; see *mount(II).*

    Only the super-user can execute umount.

**SEE ALSO**

    umount(VIII), mount(II)

**DIAGNOSTICS**

    Error bit (c-bit) set if no file system was mounted on the special file or if there are still active files on the
    mounted file system.
